Home Overview Models Context Explain Robustness Help About
This view explains why a case received its prioritization score. All explanations are read from the completed analysis run; no additional model inference is performed in this tab.
Select case to explain
Evelyn Taylor
General explanation
The case prioritization score for Evelyn Taylor is 83%. This decision reflects a balanced posture (λ=0.50), combining critical predictive risk (96%) with high contextual alignment (70%). On the predictive side, risk was driven mainly by Department (Sales) and Overtime (Yes). In context, the case aligns strongly with the policy rules, particularly on Relevant years at company and Age investment window.
Suggestion [Tier 1 - High Priority]: Recommended to proceed with intervention or resource allocation immediately.
